Suggested Answers/ Solution
PART I – Case Scenario based MCQs

1. i. **A** Revised Sale = $\frac{\text{Revised Fixed Cost} + \text{Expected Profit}}{\text{P / V Ratio}}$
 $= \{₹115 + (20+10)\} \div 45\% = ₹ 322.22 \text{ crores}$
- ii. **D** Revised Break – even Point = $\frac{\text{Fixed Cost}}{\text{P / V Ratio}}$
 $= ₹115 \text{ Crore} \div 45\% = ₹255.56 \text{ Crore (Refer working notes)}$
- iii. **D** Revised Margin of Safety = Revised Sales – Revised Break–even Sales
 $= ₹ 322.22 \text{ Crores} - ₹ 255.56 \text{ Crores} = ₹ 66.66 \text{ Crores.}$
- iv. **C** ₹ 20 Crore & ₹30 Crore respectively (Refer working note)
- v. **A** Total cost in last year = ₹230 Crore
Total cost in coming year = Variable Cost + Fixed Cost
Revised sales × 55% + 115 Crore
 $= ₹ 322.22 \text{ Crore} \times 55\% + ₹ 115 \text{ Crore} = ₹ 292.22 \text{ Crore}$

Working Note

Present Sales and Profit

Total Sales = Break – even Sales + Margin of Safety
 $= ₹ 200 \text{ Crores} + ₹ 50 \text{ Crores}$
 $= ₹ 250 \text{ Crores}$

P/V Ratio = 40%

Variable Cost = 60% of Sales
 $= ₹ 250 \text{ Crores} \times 60\%$
 $= ₹ 150 \text{ Crores}$

Fixed Cost = Break – even Sales × P/V Ratio
 $= ₹ 200 \text{ Crores} \times 40\%$
 $= ₹ 80 \text{ Crores}$

$$\begin{aligned}
\text{Total Cost} &= ₹ 150 \text{ Crores} + ₹ 80 \text{ Crores} \\
&= ₹ 230 \text{ Crores} \\
\text{Profit} &= \text{Total Sales} - \text{Total Cost} \\
&= ₹ 250 \text{ Crores} - ₹ 230 \text{ Crores} \\
&= ₹ 20 \text{ Cores}
\end{aligned}$$

Revised Sales (₹ in Crores)

Present Fixed Cost	80.00
Increase in Fixed Cost	20.00
Interest at 15 <i>per cent</i> on Additional Capital (₹100Crores × 15%)	15.00
Total Revised Fixed Cost (in crore)	115.00
Assuming that the Present Selling Price is ₹100	
Revised Selling Price will be (8% Less)	92.00
New Variable Cost (Reduced from 60% to 55%) of Sales (₹ 92 × 55%)	50.60
Contribution (₹92.00 – ₹ 50.60)	41.40

$$\begin{aligned}
\text{New P / V Ratio} &= \frac{₹ 41.40}{₹ 92.00} \times 100 \\
&= 45\%
\end{aligned}$$

2. i. **D Variable Overhead Cost** = Standard Variable Overheads for Production – Actual
Variance Variable Overheads
= ₹ 44,800 – ₹ 55,680
= ₹ 10,880 (A)
- ii. **C Fixed Overhead Volume** = Absorbed Fixed Overheads – Budgeted Fixed Overheads
Variance
= ₹ 87,200 – ₹ 1,09,000
= ₹ 21,800 (A)
- iii. **A Fixed Overhead Expenditure** = Budgeted Fixed Overheads – Actual Fixed Overheads
Variance
= ₹ 10.9 × 10,000 units – ₹ 1,30,520
= ₹ 21,520 (A)
- iv. **B Calendar Variance** = Possible Fixed Overheads – Budgeted Fixed Overheads
= ₹ 1,03,550 – ₹ 1,09,000

$$= ₹ 5,450 \text{ (A)}$$

v. **A Fixed Overhead Cost Variance** = Absorbed Fixed Overheads – Actual Fixed Overheads
 $= ₹ 87,200 - ₹ 1,30,520$
 $= ₹ 43,320 \text{ (A)}$

(b) (i) Calculation of Economic Order Quantity

$$\begin{aligned}
 \text{EOQ} &= \sqrt{\frac{2 \times \text{Annual Demand} \times \text{Ordering Cost}}{\text{Carrying cost per unit per annum}}} \\
 &= \sqrt{\frac{2 \times 12,000 \text{ units} \times ₹1,200}{₹1,740 \times 0.12}} = 371 \text{ units (Approx)}
 \end{aligned}$$

(ii) Evaluation of Profitability of Different Options of Order Quantity

(a) When EOQ is ordered

		(₹)
Purchase Cost	(12,000 units × ₹ 1,740)	2,08,80,000.00
Ordering Cost*	[(12,000 units ÷ 371 units) i.e. 33 × ₹ 1,200]	39,600.00
Carrying Cost**	(371 units × ₹ 1,740 × ½ × 12/100)	38,732.40
Total Cost		2,09,58,332.40

(b) When Quantity Discount of 5% is offered.

		(₹)
Purchase Cost	(12,000 units × ₹ 1,740 × 0.95)	1,98,36,000.00
Ordering Cost*	[(12,000 units ÷ 6,000 units) × ₹1,200]	2,400.00
Carrying Cost**	(6,000 units × ₹1,653 × ½ × 12/100)	5,95,080.00
Total Cost		2,04,33,480.00

Advise – The total cost of inventory is lower if quantity discount offer is accepted. Hence, the company is advised to accept the quantity discount.

$$* \text{ Ordering Cost} = \frac{\text{Annual Demand}}{\text{Order Quantity}} \times \text{Cost of placing an order}$$

$$** \text{ Carrying Cost} = \frac{\text{Cost per unit} \times \text{Quantity ordered} \times \text{Carrying Cost}}{2}$$

- (c) Let T hours be the total time worked in hours by the skilled worker (machine-man Sam); ₹ 30/- is the rate per hour; standard time is 4 hours per unit and effective hourly earning rate is ₹ 37.50 then

Earning = Hours worked × Rate per hour

$$+ \frac{\text{Time saved}}{\text{Time allowed}} \times \text{Time taken} \times \text{Rate per hour}$$

(Under Rowan incentive plan)

$$₹ 37.5 T = (T \times ₹ 30) + \frac{(4-T)}{4} \times T \times ₹ 30$$

$$₹ 37.5 = ₹ 30 + (4 - T) \times ₹ 7.5$$

$$\text{Or } ₹ 7.5 T = ₹ 22.5$$

Or T= 3 hours

Total earnings and effective hourly rate of skilled worker (machine man Sam) under Halsey Incentive Scheme (50%)

Total earnings = (Hours worked × Rate per hour) + (½ Time saved × Rate per hour)

(under 50% Halsey Incentive Scheme)

$$= (3 \text{ hours} \times ₹ 30) + (\frac{1}{2} \times 1 \text{ hour} \times ₹ 30)$$

$$\text{Effective hourly rate} = \frac{\text{Total earnings}}{\text{Hours taken}} = \frac{₹ 105}{3 \text{ hours}} = ₹ 35$$

(v) Interest on capital outlay is a financial matter and, therefore it has been excluded from the cost accounts.

(b) Economic batch quantity in Batch Costing: In batch costing the most important problem is the determination of 'Economic Batch Quantity'. The determination of economic batch quantity involves two types of costs viz, (i) set up cost and (ii) carrying cost. With the increase in the batch size, there is an increase in the carrying cost but the set up cost per unit of product is reduced. This situation is reversed when the batch size is reduced. Thus there is one particular batch size for which both set up and carrying costs are minimum. This size of a batch is known as economic or optimum batch quantity.

Economic batch quantity can be determined with the help of table, graph or mathematical formula. The mathematical formula usually used for its determination is as follows:

$$E.B.Q = \sqrt{\frac{2DS}{C}}$$

Where, D= Annual demand for the product

S = Setting up cost per batch

C = Carrying cost per unit of production per annum

Selling overhead			81,000
Distribution overhead			<u>62,100</u>
	Total Cost		<u>6,99,900</u>

Schedule of Overhead Rate

(i) Works Overhead: Hourly rate = (Overhead amount ÷ Hours)

Machine shop = (88,200 ÷ 12,000) = ₹ 7.35 per hour

Assembly shop = (51,800 ÷ 10,000) = ₹ 5.18 per hour

(ii) Administrative Overhead as a % of works cost

$$= \frac{92,800}{4,64,000} \times 100 = 20\%$$

(iii) Selling and distribution overhead as % of works cost

$$= \frac{81,000 + 62,100}{4,64,000} \times 100 = 30.84\%$$

Labour hour rates are calculated as under:

Machine shop = ₹ 63,000 ÷ 12,000 hrs. = ₹ 5.25

Assembly shop = ₹ 48,000 ÷ 10,000 hrs. = ₹ 4.80

(b) Detection of slow moving and non-moving item of stores:

The existence of slow moving and non-moving item of stores can be detected in the following ways.

- By preparing and *perusing periodic reports* showing the status of different items or stores.
- By calculating the *inventory turnover period* of various items in terms of number of days/ months of consumption.

- (iii) By computing *inventory turnover ratio* periodically, relating to the issues as a percentage of average stock held.
- (iv) By implementing the use of a well designed information system.

Necessary steps to reduce stock of slow moving and non-moving item of stores:

- (i) Proper procedure and guidelines should be laid down for the disposal of non-moving items, before they further deteriorates in value.
 - (ii) Diversify production to use up such materials.
 - (iii) Use these materials as substitute, in place of other materials.
- (c) When the Cost and Financial Accounts are integrated - there is no need to have a separate reconciliation statement between the two sets of accounts. Integration means that the same set of accounts fulfil the requirement of both i.e., Cost and Financial Accounts.

(a) Calculation of tariff rate per room

Tariff per room per day = (Total cost + 25% Margin on total cost) ÷ Total occupancy

$$= (\text{₹ } 78,45,000 + 19,61,250) \div 5,040 = \text{₹ } 1,945.68$$

(b) Calculation of break-even occupancy

Contribution per day = Tariff – Variable cost

$$= \text{₹ } 1,945.68 - 500 = \text{₹ } 1,445.68$$

$$\text{Break-even occupancy} = \text{₹ } 53,25,000 \div 1,445.68$$

$$= 3683$$

Occupancy in normal season = Break-even occupancy – Occupancy in off-season

$$= 3683 - (20 \text{ rooms} \times 50\% \times 4 \text{ months} \times 30 \text{ days})$$

$$= 3683 - 1200 = 2483 \text{ room-days}$$

$$\text{In Percentage} = 2483 \div 4800 = 51.73\%$$

6. (a) When the cost and financial accounts are kept separately, It is imperative that these should be reconciled, otherwise the cost accounts would not be reliable. The reconciliation of two set of accounts can be made, if both the sets contain sufficient detail as would enable the causes of differences to be located. It is therefore, important that in the financial accounts, the expenses should be analysed in the same way as in cost accounts. It is important to know the causes which generally give rise to differences in the costs & financial accounts. These are:

(i) Items included in financial accounts but not in cost accounts

- Income-tax
- Transfer to reserve

- Dividends paid
 - Goodwill / preliminary expenses written off
 - Pure financial items
 - Interest, dividends
 - Losses on sale of investments
 - Expenses of Co's share transfer office
 - Damages & penalties
- (ii) Items included in cost accounts but not in financial accounts
- Opportunity cost of capital
 - Notional rent
- (iii) Under / Over absorption of expenses in cost accounts
- (iv) Different bases of inventory valuation

Motivation for reconciliation is:

- To ensure reliability of cost data
- To ensure ascertainment of correct product cost
- To ensure correct decision making by the management based on Cost & Financial data
- To report fruitful financial / cost data.

(b) The essential features, which a good Cost Accounting System should possess, are as follows:

OR

- (c) CVP Analysis:-Assumptions
- (i) Changes in the levels of revenues and costs arise only because of changes in the number of products (or service) units produced and sold.
 - (ii) Total cost can be separated into two components: Fixed and variable
 - (iii) Graphically, the behaviour of total revenues and total cost are linear in relation to output level within a relevant range.
 - (iv) Selling price, variable cost per unit and total fixed costs are known and constant.
 - (v) All revenues and costs can be added, sub traded and compared without taking into account the time value of money.
